Polymer dispersions and microplastics

EPDLA (European Polymer Dispersion and Latex Association, a Cefic Sector Group) is dedicated to promoting the safe manufacture, transportation, distribution, handling and use of waterborne polymer dispersions, in compliance with regulatory requirements and industry guidelines.

EPDLA members are committed to Responsible Care® principles and have implemented risk management according to the precautionary principles.

Polymer dispersions

Polymer dispersions are used as raw materials (binders) in many waterborne applications, for example in adhesives, varnishes and coatings, printing inks, non-wovens, paper and paperboard and textile finishing agents. Polymer dispersion technology has been used safely and successfully for more than 50 years and has contributed significantly to a reduction in the release of organic solvents into the environment. The use of polymer dispersions has helped to reduce the use of organic solvents in workplaces leading to improved worker health and similarly has contributed to cleaner air in the home. Common to all dispersions and covered by this statement, is a film forming process during application.

Polymer dispersions are mixtures as defined under Article 3(2) of the REACH Regulation, consisting mainly of water and high molecular weight polymer droplets. Based on polymer weight and chemical nature, the polymer droplets can be solid or highly viscous. The particle size of such polymer droplet can widely vary between ca. <100 nm (<0.1 μm) and 10,000 nm (10 μm) in diameter. Polymer dispersions are not categorised as nanomaterials. For more details, please refer to the EPDLA position paper on nanomaterials.

The polymer droplets are dispersed and stabilised in water and regarded as bound in the liquid matrix. They cannot be isolated as discrete droplets or particles by simple separation techniques and do not exist without their waterborne environment. Their fate is to form a film e.g. as an adhesive or paint. As the water in the mixture evaporates, a separation between the aqueous and the polymeric phase begins and leads to the film formation via coalescence of the polymer droplets.

Human or environmental exposure to individual polymer droplets or particles is thus highly unlikely under advised conditions of use.

2 nm = nanometre / μm = micrometre

Microplastics and Polymer Dispersions

On January 30th, 2019, ECHA published an ANNEX XV RESTRICTION REPORT concerning a PROPOSAL FOR A RESTRICTION of intentionally added microplastics⁴.

According to the proposal ECHA defined microplastics as:

a. *a material consisting of solid polymer-containing particles, to which additives or other substances may have been added, and where ≥ 1% w/w of particles have (i) all dimensions 1nm ≤ x ≤ 5mm, or (ii), for fibres, a length of 3nm ≤ x ≤ 15mm and length to diameter ratio of >3.*

b. ‘particle’ is a minute piece of matter with defined physical boundaries; a defined physical boundary is an interface.

c. ‘polymer-containing particle’ means either (i) a particle of any composition with a continuous polymer surface coating of any thickness or (ii) a particle of any composition with a polymer content of ≥ 1% w/w.

Our understanding is that polymer dispersions containing solid particles would fall under the scope of the restriction. These definitions apply both to individual substances or mixtures where microplastics may be present at a concentration 0.01% w/w, such as, for example, in adhesives or paints. The restriction document continues further and makes allowances for the placing on the market of polymer dispersions or mixtures containing microplastics if:

a) They are used at industrial sites or

b) “Their physical properties are permanently modified when the substance or mixture is used such that the polymers no longer fulfil the meaning of a microplastic according to the definitions quoted above. “

Since the intended use of the polymer dispersion is to form a film, the polymer particles are consumed during film formation and therefore no longer meet the definition of a microplastic. The microplastic droplets would be permanently incorporated into a solid matrix at the point of use.

We therefore understand that the use of polymer dispersions for its entire myriad of applications will not be restricted under this proposal. However, ECHA foresees labelling and reporting requirements, “as there could be some releases of ‘unconsumed’ microplastics under reasonably foreseeable conditions of use”.

To minimize these releases industry will be required to communicate appropriate use instructions: ECHA’s proposal “will require all downstream users placing on the market mixtures containing microplastics, where the use of the microplastic is derogated” … “to report certain information to ECHA using a prescribed electronic format. This information can then be compiled and published annually. The information gathered will allow the tracking of the identity and quantities of the microplastics

---

used and released to the environment in certain derogated uses and allow in the future for adaptations to the restriction to be made using this information, where these are considered necessary.”

More details on the labelling and reporting requirements are to be published at a later stage. EPDLA will closely monitor any developments and actively advocate minimizing the burden for producers, sellers, and users of polymer dispersions and products containing them.

Conclusion

EPDLA supports Cefic’s position on the publication of the REACH restriction proposal on microplastics: We call for a regulatory measure that is proportionate, scientifically sound and brings tangible benefit to the environment.

ECHA’s restriction proposal contains a definition of microplastics, which EPDLA considers still too broad and leaving much room for interpretation, and which will make its implementation and enforcement challenging.

We therefore call for a clearer and enforceable definition of microplastics to be included in the final restriction proposal.

A public consultation on ECHA’s restriction proposal started March 20th, 2019. EPDLA intends to provide comments highlighting our position during the public consultation period and would urge all parties potentially impacted by the restriction proposal to do the same to ensure a balanced, pragmatic and workable outcome.
Disclaimer

- The present position paper has been developed by EPDLA members in good faith, to the best of its knowledge and following the latest scientific evidence.
- The position paper is offered to all EPDLA members for further use. Each producer might add additional information in the communication towards customers, depending on the specific situation.
- EPDLA commits to update this document in view of any new relevant available information.
